L
ISO/IEC-input linearization method

V
AEG90-7N

Output - Input - Output: A loop for relative colour fidelity with the visual rgb^* and LCh^* CIELAB data

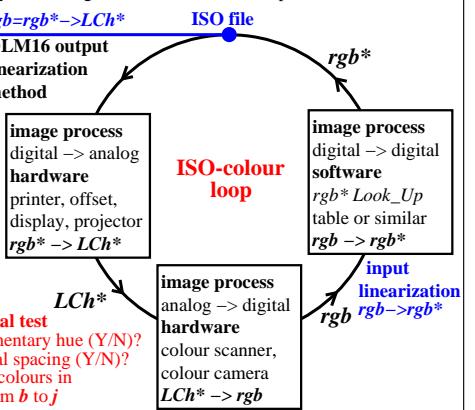

For the ISO-test file with 729 colours, see http://standards.iso.org/iso/9241/306/ed-2/AE49/AE49F0PX_CY8_1.PDF
Use the OLM16 method for output linearization, see or buy one, or use PG4311L of Colour and Colour Vision, [see http://farbe.li.tu-berlin.de/OUTLIN16_01.PDF](http://farbe.li.tu-berlin.de/OUTLIN16_01.PDF).

Then there are linear relations between rgb^* and LCh^* . Use reference test chart with 729 CIELAB colours

Colour scanners or cameras produce 729 rgb data.

Transfer the 729 rgb data to the 729 rgb^* data.

After the linearized input the 729 colour data rgb^* may be used again for the linearized output.

Improved standardization

Interdisciplinary standards shall replace isolated standards to realize the properties of the ISO-colour loop. The output shall be equal for $rgb^*/cmyk^*$ data according to the 1-Minus-Relation (1MR) and continuous.

Display output with $rgb^*/cmyk^*$ data

For different display reflections at work places with the display or printer driver different relative gamma shall produce an ergonomic output. Any printer shall have a $cmyk^*$ -input channel as an option to produce an ergonomic output.

Print output with $rgb^*/cmyk^*$ data

For different paper contrast at work places with the display or printer driver different relative gamma shall produce an ergonomic output. Any printer shall have a $cmyk^*$ -input channel as an option to produce an ergonomic output.

A general ergonomic solution instead of the gamma transfer is the transfer of 16,7 million $rgb^*/cmyk^*$ to $rgb^*/cmyk^*$ data.
