Status: Preliminary decision of CIE TC1-69 in Sun City: Selection of colour samples (by end of July)

Starting point of this presentation:

A wish to keep the present colour samples no. 9 to 12 of CIE 13.3.

- No. 9 to 12 represent the “typical” Red, Yellow, Green, Blue (RJGB) of high chroma and different lightness.
- No. 9 to 12 represent the hue angles of the elementary colours according to CIE R1-47:2009. Hue shifts can be easily described.
- No. 9 to 12 and all others of CIE 13.3 are used in ISO/IEC standards, for example ISO/IEC 15775 for colour copiers.

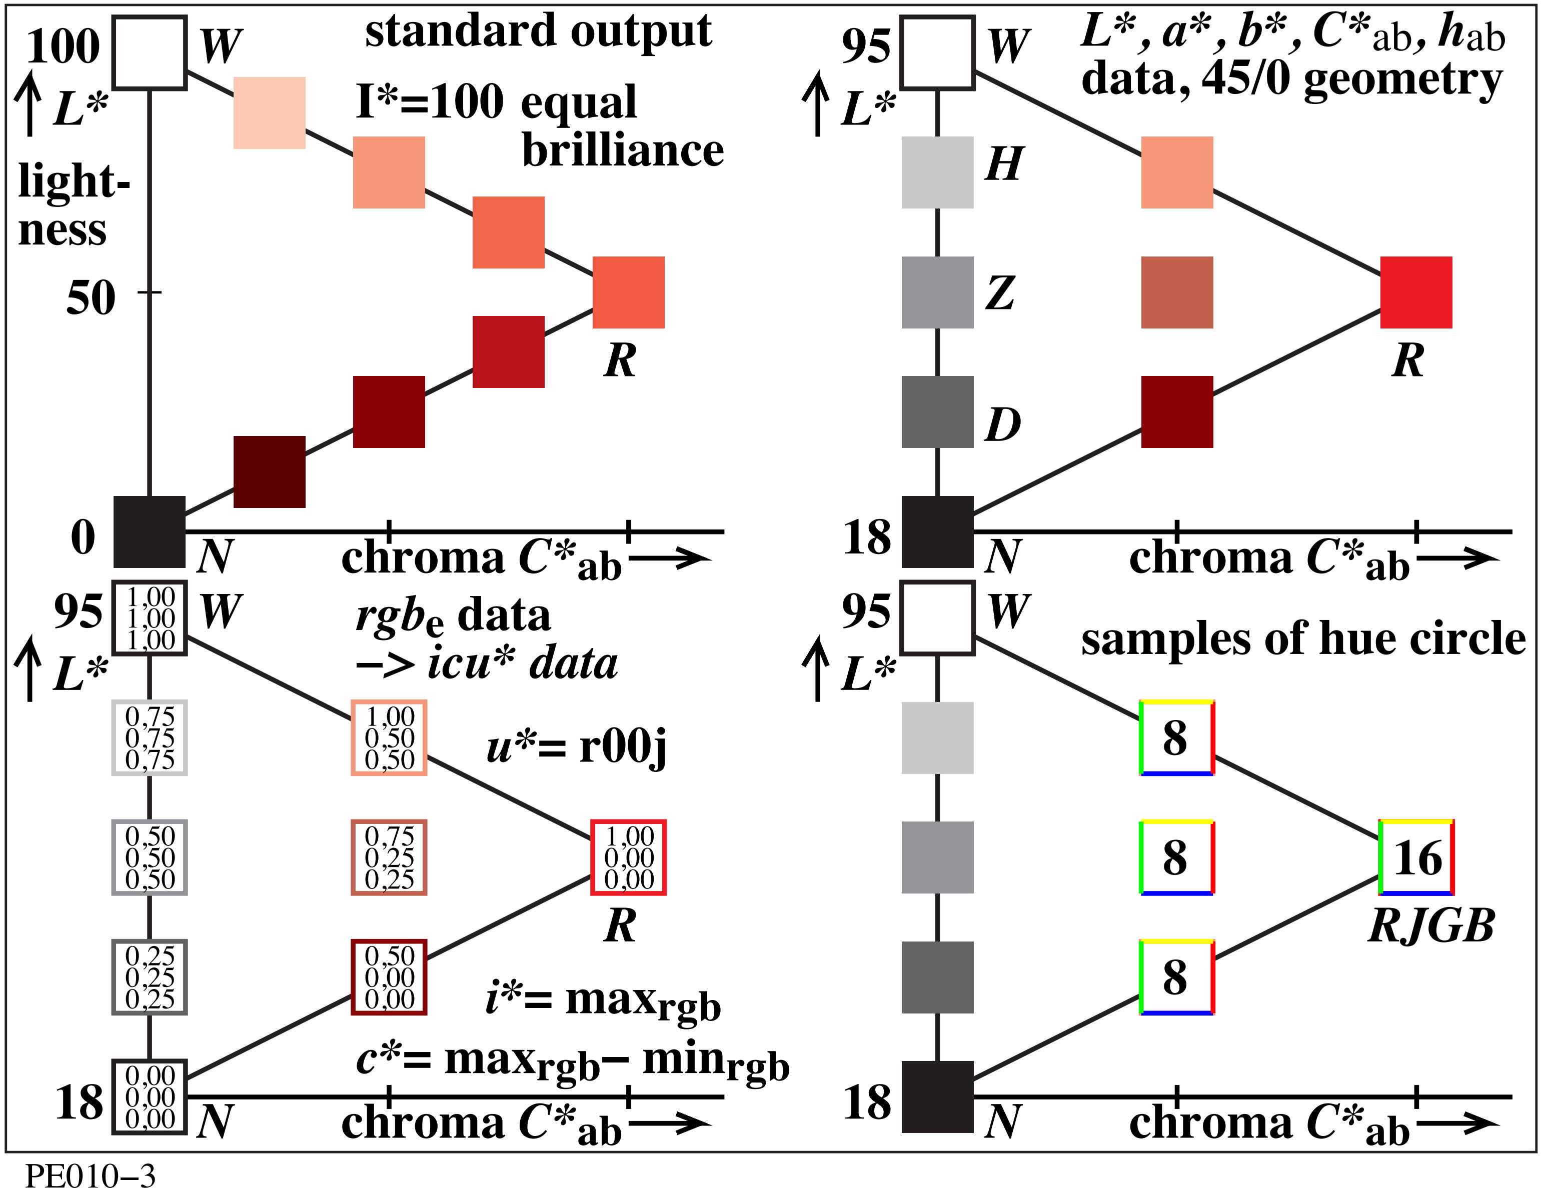

Fig.1: Proposed selection of 45 (=16+24+5) colours based on no. 9 to 12

Proposal for a selection of available 45 (and 12 metameric) samples

1. Use offset colour samples produced with standard offset colours on standard offset paper which is fluorescent free according to ISO/IEC 15775 (long term standard colours used in image technology).
2. Use the offset colours of maximum chroma with the CIELAB hue angles 26, 92, 162 and 272 which are equal in hue angle to no. 9 to 12 of CIE 13.3
3. Use a 16 step elementary colour circle with 3 colour samples between the elementary hues, for example r25j, r50j, r75j.
4. Use three 8 step colour circles of half the chroma compared to the maximum offset chroma: lighter, similar lightness and darker
5. Use 5 or 9 grey steps
6. Add 8 metameric samples of the colour circle with similar lightness
7. Add 5 metameric greys produced by *cmy* only.
8. Add a table with rgb_e and for example *icu** data (relative brilliance, relative chroma, elementary hue text according to DIN 33872-1 to 6)

The spectral reflection of the achromatic colours is flat
(because of the production method “complete under colour removal”)

Advantage of the proposal:

1. Available colour samples (size 3x3cm) including spectral reflection for the 45/0 geometry.
2. Large contrast range between *Y*=2,5 and 90 (*L**=18 and 95).
3. Link of the samples to the samples No. 9 to 12 of CIE 13.3
4. Link to image technology by rgb_e data and relative colour space data of the natural elementary colour system, for example *icu** (relative brilliance *i**, relative chroma *c**, and elementary hue text *u**)
5. Link to ISO/IEC standards which use the present test colour samples of CIE 13.3 to specify colour reproduction properties by the CRI (for example ISO/IEC 15775, ISO/IEC TR 24705, ISO 9241-306)

rgb* and CIE data of a elementary hue circle according to CIE R1-47:2009 for offset print

16 step elementary hue circle with intended elementary hues: h_{ab} = 25.4 , 92.3 , 162.2 , 271.7

Fig. 2: *rgb data, *adapted* and *standard* CIELAB data and CIE data *X, Y, Z, x, y* of a 16 step hue circle and a 5 step grey scale**

Fig 2 shows *rgb** data and the CIELAB data of the 16 step hue circle and a 5 step grey scale for the standard offset print on the standard *non fluorescent* offset paper.

The data are calculated from a 48 step device hue circle (data see Fig. 3) of a real print. In the example the achromatic colours are printed by only the black offset colorant. In addition Fig. 3 shows the CIE data X, Y, Z, the chromaticity coordinates $x, y,$ and the *standard* CIELAB data $L^*, a^*,$ and b^* for the CIE 2 degree observer, for the CIE standard illuminant D65 and for CIE 45/0 measurement geometry

The equations between standard and adapted CIELAB data use the *relative* CIELAB lightness l^*_r:

$$l^*_r = (L^* - L^*_N) / (L^*_W - L^*_N)$$

$$L^*_a = L^*$$

$$a^*_a = a^* - a^*_N - l^*_r\,(a^*_W - a^*_N)$$

$$b^*_a = b^* - b^*_N - l^*_r\,(b^*_W - b^*_N)$$

Is valid $(a^*_N, a^*_N) = (a^*_W, a^*_W) = (0, 0)$ and similar for b^*, see Fig. 3.

KE070−7N: Measurement: %BEG 'KK0X'REM_OFFS04_080929_3.TXTOffset print, model separation cmyn6*, Page 1 /1

Fig. 4: Reflectance factor $R(\lambda)$ between λ=380 and 770nm, *rgb** data, and CIE data of Fig. 3 of a 16 step hue circle and a 5 step grey scale

Fig. 4 shows the reflectance factor between λ = 380 and 770nm, the *rgb** data, and all the CIE data of Fig. 3 for a 16 step hue circle and a 5 step grey scale

The CIELAB data are calculated for the given interpolated reflectance factors. However, the real output of the elementary colour circle has been measured too. The printed colour circle includes CIELAB data od the standard offset print.

The reflectance factor of the 5 grey steps are approximately flat because only the achromatic colorant of offset has been used for the production.

Another example for a 3 dye photo printer show 3 maxima and minima of the reflectance factor curve for the grey colours (except for white), see

http://130.149.60.45/~farbmetrik/KE06/KE060-7N.PDF

Annex A includes the data of a 48 step device hue circle, which is used to interpolate the CIE data and the reflectance factor for the *rgb** data.

48 step circle with interpretation *rgb –> olv device hue steps of 1080 standard colours**

*rgb –> olv**	$h_{ab,a}$	*L**	a^*_a	b^*_a	*rgb –> olv**	$h_{ab,a}$	*L**	a^*_a	b^*_a	*rgb –> olv**	$h_{ab,a}$	*L**	a^*_a	b^*_a	*rgb –> olv**	$h_{ab,a}$	*L**	a^*_a	b^*_a	*rgb –> olv**	$h_{ab,a}$	*L**	a^*_a	b^*_a	*rgb –> olv**	$h_{ab,a}$	*L**	a^*_a	b^*_a

Fig. 5: Reflectance factor $R(\lambda)$ between λ=380 and 770nm, *rgb data, and CIE data of Fig. 3 of a 16 step hue circle and a 5 step grey scale**

Fig. 5 shows the reflectance factor between λ = 380 and 770nm, the *rgb** data, and all the CIE data of Fig. 3 for a 16 step hue circle and a 5 step grey scale

The CIELAB data are calculated for the given interpolated reflectance factors. However, the real output of the elementary colour circle has been measured too. The printed colour circle includes CIELAB data od the standard offset print.

The reflectance factor of the 5 grey steps are approximately flat because only the achromatic colorant of offset has been used for the production.

Another example for a 3 dye photo printer show 3 maxima and minima of the reflectance factor curve for the grey colours (except for white), see

http://130.149.60.45/~farbmetrik/KE06/KE060-7N.PDF

Annex A includes the data of a 48 step device hue circle, which is used to interpolate the CIE data and the reflectance factor for the *rgb** data.

Summary

A method is given how to calculate the spectral reflectance factors $R(\lambda)$ and many CIE data including CIELAB for a 16 step elementary hue circle in standard offset printing according to ISO/IEC 15775.

For this goal a 48 step device colour scale is used as start output which has 9 step colour series, for example between device Orange red *O* and device Yellow *Y*.

It is proposed that the spectral reflectance factors $R(\lambda)$ of the 16 samples and /or the real samples of the elementary hue circle may be used to specify the colour rendition of light sources in CIE TC1-69.

At the same time the linear relations between *rgb** data and CIELAB data define a device independent *rgb** system which is based on the human visual *elementary hue angles* in CIELAB, see the report CIE R1-47:2009.

The *Relative Elementary Colour System RECS* shows about 2000 colour samples in standard offset print on standard offset paper according to ISO/IEC 15775. This System includes a realization of the *16 step elementary hue circle* which is proposed here.

Annex A

Fig. A.1 and Fig. A.2 show examples of measured reflectance factor of different sample pairs and shows the samples in CIELAB *(a*, b*)*.

These data are here produced by the *start output* using *rgb* input data which are interpreted as device data *olv**, compare "interpretation" of *rgb* data as *olv** data (symbol *rgb -> olv**) in Fig. 4.

These sample pairs are from the *start output* of the 48 step hue circle.

Always one sample pair is used for the interpolation of the reflectance factor of one sample of the 16 step elementary hue circle.

Fig. A.1 shows the intermediate reflectance factors and the 3 reflectance factors of the three samples *r00j=R, r25j,* and *r50j*.

Fig. A.2 shows the 16 reflectance factors, and the CIE data of all samples of the 16 step elementary colour circle which are also given in Fig. 4.

Fig. A.1 includes the 48 step colour circle in a (a^*_a, b^*_a) chroma diagram and in addition Fig. A.2 the 16 step colour circle in (a^*_a, b^*_a).
